

A Universal Turing Machine

A limitation of Turing Machines:

Turing Machines are "hardwired"

they execute
only one program

Real Computers are re-programmable

Solution: Universal Turing Machine

Attributes:

- Reprogrammable machine
- Simulates any other Turing Machine

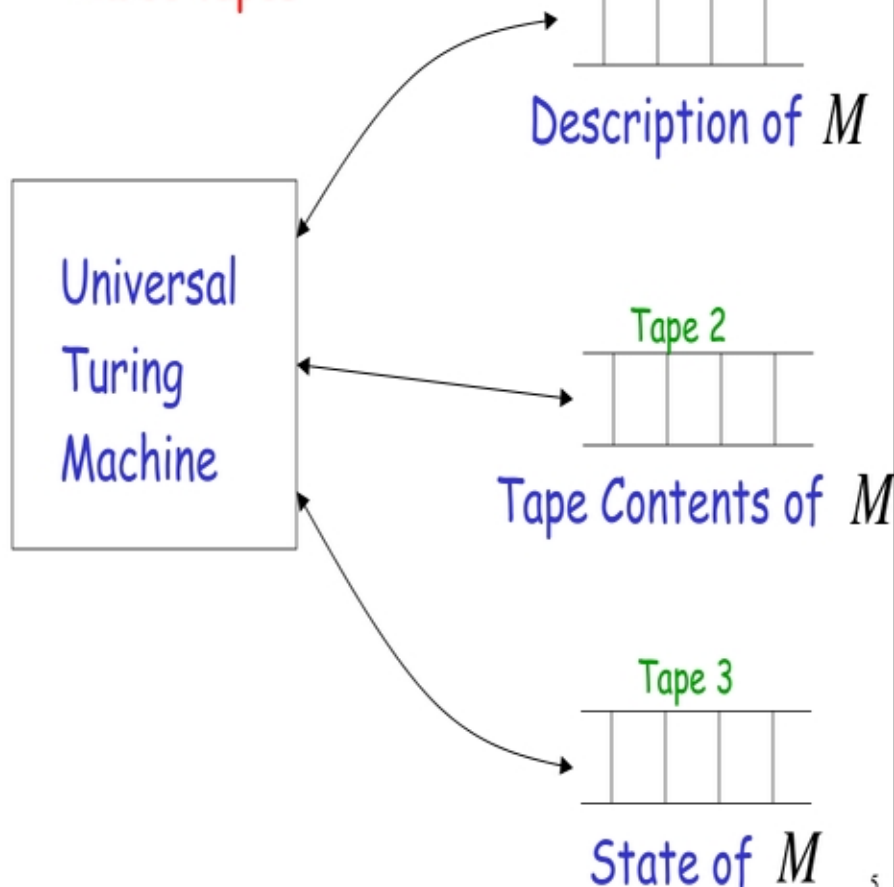

Universal Turing Machine
simulates any other Turing Machine M

Input of Universal Turing Machine:

Description of transitions of M

Initial tape contents of M

Three tapes

Tape 1

Description of M

We describe Turing machine M
as a string of symbols:

We encode M as a string of symbols

Alphabet Encoding

Symbols:	a	b	c	d	...
					
Encoding:	1	11	111	1111	

State Encoding

States:	q_1	q_2	q_3	q_4	...
					
Encoding:	1	11	111	1111	

Head Move Encoding

Move:	L	R
		
Encoding:	1	11

Transition Encoding

Transition: $\delta(q_1, a) = (q_2, b, L)$

Encoding:

10101101101

separator

Machine Encoding

Transitions:

$\delta(q_1, a) = (q_2, b, L)$ $\delta(q_2, b) = (q_3, c, R)$

Encoding:

10101101101 00 1101101110111011

separator

Tape 1 contents of Universal Turing Machine:

encoding of the simulated machine M
as a binary string of 0's and 1's

A Turing Machine is described
with a binary string of 0's and 1's

Therefore:

The set of Turing machines forms a language:

each string of the language is
the binary encoding of a Turing Machine

Language of Turing Machines

$L = \{$ 010100101, (Turing Machine 1)
00100100101111, (Turing Machine 2)
111010011110010101,
..... }

Countable Sets

Infinite sets are either:

Countable

or

Uncountable

Countable set:

Any finite set

or

Any *Countably infinite* set:

There is a one to one correspondence

between

elements of the set

and

Natural numbers

Example: The set of even integers
is countable

Even integers: 0, 2, 4, 6, ...

Correspondence:

Positive integers: 1, 2, 3, 4, ...

$2n$ corresponds to $n+1$

Example: The set of rational numbers
is countable

Rational numbers: $\frac{1}{2}, \frac{3}{4}, \frac{7}{8}, \dots$

Naïve Proof

Rational numbers: $\frac{1}{1}, \frac{1}{2}, \frac{1}{3}, \dots$

Correspondence:

Positive integers: 1, 2, 3, ...

Doesn't work:

we will never count
numbers with nominator 2: $\frac{2}{1}, \frac{2}{2}, \frac{2}{3}, \dots$

Better Approach

$\frac{1}{1}$ $\frac{1}{2}$ $\frac{1}{3}$ $\frac{1}{4}$...

$\frac{2}{1}$ $\frac{2}{2}$ $\frac{2}{3}$...

$\frac{3}{1}$ $\frac{3}{2}$...

$\frac{4}{1}$...

$$\frac{1}{1} \xrightarrow{\quad} \frac{1}{2} \quad \frac{1}{3} \quad \frac{1}{4} \quad \dots$$

$$\frac{2}{1} \quad \frac{2}{2} \quad \frac{2}{3} \quad \dots$$

$$\frac{3}{1} \quad \frac{3}{2} \quad \dots$$

$$\frac{4}{1} \quad \dots$$

$$\frac{1}{1} \xrightarrow{\quad} \frac{1}{2} \quad \frac{1}{3} \quad \frac{1}{4} \quad \dots$$

$$\frac{2}{1} \quad \frac{2}{2} \quad \frac{2}{3} \quad \dots$$

$$\frac{3}{1} \quad \frac{3}{2} \quad \dots$$

$$\frac{4}{1} \quad \dots$$

$$\frac{1}{1} \xrightarrow{\quad} \frac{1}{2} \quad \frac{1}{3} \quad \frac{1}{4} \quad \dots$$

$$\frac{2}{1} \quad \frac{2}{2} \quad \frac{2}{3} \quad \dots$$

$$\frac{3}{1} \quad \frac{3}{2} \quad \dots$$

$$\frac{4}{1} \quad \dots$$

$$\frac{1}{1} \xrightarrow{\quad} \frac{1}{2} \quad \frac{1}{3} \quad \frac{1}{4} \quad \dots$$

$$\frac{2}{1} \quad \frac{2}{2} \quad \frac{2}{3} \quad \dots$$

$$\frac{3}{1} \quad \frac{3}{2} \quad \dots$$

$$\frac{4}{1} \quad \dots$$

We proved:

the set of rational numbers is countable
by describing an **enumeration procedure**

Definition

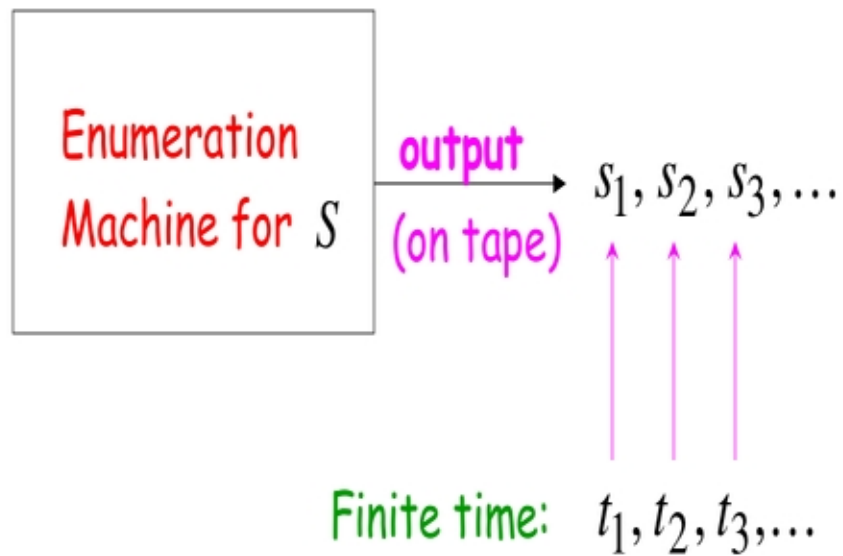

Let S be a set of strings

An **enumeration procedure** for S is a
Turing Machine that generates
all strings of S one by one

and

Each string is generated in finite time

strings $s_1, s_2, s_3, \dots \in S$

Enumeration Machine

Configuration

Time 0

Time t_1

Time t_2

Time t_3

Observation:

If for a set there is an enumeration procedure, then the set is countable

Example:

The set of all strings $\{a,b,c\}^+$
is countable

Proof:

We will describe an enumeration procedure

Naive procedure:

Produce the strings in lexicographic order:

a

aa

aaa

aaaa

.....

Doesn't work:

strings starting with *b*
will never be produced

Better procedure: Proper Order

1. Produce all strings of length 1
2. Produce all strings of length 2
3. Produce all strings of length 3
4. Produce all strings of length 4

.....

Produce strings in
Proper Order:

a
b
c } length 1

aa
ab
ac
ba
bb
bc
ca
cb
cc } length 2

aaa
aab
aac
..... } length 3

Theorem: The set of all Turing Machines is countable

Proof: Any Turing Machine can be encoded with a binary string of 0's and 1's

Find an enumeration procedure for the set of Turing Machine strings

Enumeration Procedure:

Repeat

1. Generate the next binary string of 0's and 1's in proper order
2. Check if the string describes a Turing Machine
 - if **YES:** print string on output tape
 - if **NO:** ignore string

Uncountable Sets

Definition: A set is uncountable
if it is not countable

Theorem:

Let S be an infinite countable set

The powerset 2^S of S is uncountable

An Application: Languages

Example Alphabet: $\{a,b\}$

The set of all Strings:

$$S = \{a,b\}^* = \{\epsilon, a, b, aa, ab, ba, bb, aaa, aab, \dots\}$$

infinite and countable

Proof:

Since S is countable, we can write

$$S = \{s_1, s_2, s_3, \dots\}$$

Elements of S

Elements of the powerset have the form:

$\{s_1, s_3\}$

$\{s_5, s_7, s_9, s_{10}\}$

.....

We encode each element of the power set with a binary string of 0's and 1's

Powerset element	Encoding				
	s_1	s_2	s_3	s_4	\dots
$\{s_1\}$	1	0	0	0	\dots
$\{s_2, s_3\}$	0	1	1	0	\dots
$\{s_1, s_3, s_4\}$	1	0	1	1	\dots

Let's assume (for contradiction)
that the powerset is countable.

Then: we can enumerate
the elements of the powerset

Powerset
element

Encoding

t_1	1	0	0	0	0	...
t_2	1	1	0	0	0	...
t_3	1	1	0	1	0	...
t_4	1	1	0	0	1	...
...						

Take the powerset element
whose bits are the complements
in the diagonal

t_1	1	0	0	0	0	...
t_2	1	1	0	0	0	...
t_3	1	1	0	1	0	...
t_4	1	1	0	0	1	...

New element: 0011...

(binary complement of diagonal)

The new element must be some t_i
of the powerset

However, that's impossible:

from definition of t_i

the i -th bit of t_i must be
the complement of itself

Contradiction!!!

Since we have a contradiction:

The powerset 2^S of S is uncountable

An Application: Languages

Example Alphabet : $\{a,b\}$

The set of all Strings:

$$S = \{a,b\}^* = \{\lambda, a, b, aa, ab, ba, bb, aaa, aab, \dots\}$$

infinite and countable

Example Alphabet : $\{a,b\}$

The set of all Strings:

$$S = \{a,b\}^* = \{\lambda, a, b, aa, ab, ba, bb, aaa, aab, \dots\}$$

infinite and countable

A language is a subset of S :

$$L = \{aa, ab, aab\}$$

Example Alphabet : $\{a,b\}$

The set of all Strings:

$$S = \{a,b\}^* = \{\lambda, a, b, aa, ab, ba, bb, aaa, aab, \dots\}$$

infinite and countable

The powerset of S contains all languages:

$$2^S = \{\{\lambda\}, \{a\}, \{a,b\}, \{aa, ab, aab\}, \dots\}$$

$L_1 \quad L_2 \quad L_3 \quad L_4 \quad \dots$

uncountable

Languages: **uncountable**

Turing machines: **countable**

There are more languages
than Turing Machines

Conclusion:

There are some languages not accepted
by Turing Machines

(These languages cannot be described
by algorithms)

Languages not accepted by Turing Machines
